Foreword

The International Organization of Legal Metrology (OIML) is a worldwide, intergovernmental organization whose primary aim is to harmonize the regulations and metrological controls applied by the national metrological services, or related organizations, of its Member States. The main categories of OIML publications are:

International Recommendations (OIML R), which are model regulations that establish the metrological characteristics required of certain measuring instruments and which specify methods and equipment for checking their conformity. OIML Member States shall implement these Recommendations to the greatest possible extent;

International Documents (OIML D), which are informative in nature and which are intended to harmonize and improve work in the field of legal metrology;

International Guides (OIML G), which are also informative in nature and which are intended to give guidelines for the application of certain requirements to legal metrology; and

International Basic Publications (OIML B), which define the operating rules of the various OIML structures and systems.

OIML Draft Recommendations, Documents and Guides are developed by Technical Committees or Subcommittees which comprise representatives from the Member States. Certain international and regional institutions also participate on a consultation basis. Cooperative agreements have been established between the OIML and certain institutions, such as ISO and the IEC, with the objective of avoiding contradictory requirements. Consequently, manufacturers and users of measuring instruments, test laboratories, etc. may simultaneously apply OIML publications and those of other institutions.

International Recommendations, Documents, Guides and Basic Publications are published in English (E) and translated into French (F) and are subject to periodic revision.

Additionally, the OIML publishes or participates in the publication of **Vocabularies** (**OIML V**) and periodically commissions legal metrology experts to write **Expert Reports** (**OIML E**). Expert Reports are intended to provide information and advice, and are written solely from the viewpoint of their author, without the involvement of a Technical Committee or Subcommittee, nor that of the International Conference of Legal Metrology. Thus, they do not necessarily represent the views of the OIML.

This publication - reference OIML R 51-2, Edition 2006 (E) - was developed by the OIML Technical Subcommittee TC 9/SC 2 *Automatic weighing instruments*. It was approved for final publication by the International Committee of Legal Metrology in 2006 and will be submitted to the International Conference of Legal Metrology in 2008 for formal sanction. This Edition supersedes the previous edition of OIML R 51-2 (Edition 1996).

OIML Publications may be downloaded from the OIML web site in the form of PDF files. Additional information on OIML Publications may be obtained from the Organization's headquarters:

Bureau International de Métrologie Légale11, rue Turgot - 75009 Paris - FranceTelephone:+33 (0)1 48 78 12 82Fax:+33 (0)1 42 82 17 27E-mail:biml@oiml.orgInternet:www.oiml.org

INTRODUCTION

This "test report format" aims at presenting, in a standardized format, the results of the various tests and examinations to which a type of an automatic catchweighing instrument shall be submitted with a view to its approval.

The test report format consists of two parts, a "checklist" and the "test report" itself.

The checklist is a summary of the examinations carried out on the instrument. It includes the conclusions of the results of the test performed, experimental or visual checks based on the requirements of Part 1. The words or condensed sentences aim at reminding the examiner of the requirements in R 51-1 without reproducing them.

The test report is a record of the results of the tests carried out on the instrument. The "test report" forms have been produced based on the tests detailed in R 51-1.

All metrology services or laboratories evaluating types of automatic catchweighing instruments accordingly to R 51 or to national or regional regulations based on this OIML Recommendation are strongly advised to use this test report format, directly or after translation into a language other than English or French. Its direct use in English or in French, or in both languages, is even more strongly recommended whenever test results may be transmitted by the country performing these tests to the approving authorities of another country, under bi- or multilateral cooperation agreements. In the framework of the *OIML Certificate System for Measuring Instruments*, the use of this test report format is mandatory.

The "information concerning the test equipment used for type evaluation" shall cover all test equipment which has been used in determining the test results given in a report. The information may be a short list containing only essential data (name, type, reference number for purpose of traceability). For example:

- Verification standards (accuracy, or accuracy class, and no.);
- Simulator for testing of modules (name, type, traceability and no.);
- Climatic test and static temperature chamber (name, type and no.);
- Electrical tests, bursts (name of the instrument, type and no.);
- Description of the procedure of field calibration for the test of immunity to radiated electromagnetic fields.

Note concerning the numbering of the following pages:

In addition to a sequential numbering at the bottom of the pages of this publication, a special place is left at the top of each page (starting with the following page) for numbering the pages of reports established following this model; in particular, some tests (e.g. metrological performance tests) shall be repeated several times, each test being reported individually on a separate page following the relevant format; in the same way, a multiple range instrument shall be tested separately for each range and a separate form (including the general information form) shall be filled out for each range. For a given report, it is advisable to complete the sequential numbering of each page by the indication of the total number of pages of the report.

Automatic catchweighing instruments Type evaluation report

EXPLANATORY NOTES

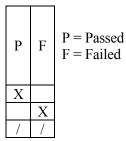

Abbreviations and symbols

Symbol	Meaning
Ι	Indication
I_n	<i>n</i> th indication
L	Load
ΔL	Additional load to next changeover point
Р	$I + 0.5 e - \Delta L$ = Indication prior to rounding (digital indication)
E	I - L or $P - L = Error$
E_0	Error at zero load
p_i	Fraction of the MPE applicable to a module of the instrument which is examined separately.
$\frac{-}{x}$	Mean of indicated readings
$\overline{x} - L$	Mean error
$d_{ m T}$	Preset tare scale interval
Temp.	Temperature
Rel. h.	Relative humidity
MPE	Maximum permissible error
MPME	Maximum permissible mean (systematic) error for automatic operation
MPSD	Maximum permissible standard deviation of the error for automatic operation
EUT	Equipment under test
SF	Significant fault
Max	Maximum capacity of the weighing instrument
Min	Minimum capacity of the weighing instrument
Max_1, Max_i, Max_r	Maximum capacity of the weighing instrument, rules for indices
$U_{ m nom}$	Nominal voltage value marked on the instrument
U_{\max}	Highest value of a voltage range marked on the instrument
U_{\min}	Lowest value of a voltage range marked on the instrument
DC	Direct current
AC	Alternating current

The name(s) or symbol(s) of the unit(s) used to express test results shall be specified in each form.

For each test, the "SUMMARY OF TYPE EVALUATION" and the "CHECKLIST" shall be completed according to this example:	Р	F	P = F =
---	---	---	------------

when the instrument has passed the test: when the instrument has failed the test: when the test is not applicable:

The white spaces in boxes in the headings of the report should always be filled according to the following example:

	At start	At end	
Temp.:	20.5	21.1	°C
Rel. h.:			%
Date:	2006-01-29	2006-01-30	yyyy-mm-dd
Time:	16:00:05	16:30:25	hh:mm:ss

"Date" in the test reports refers to the date on which the test was performed.

In the disturbance tests, faults greater than e are acceptable provided that they are detected and acted upon, or that they result from circumstances such that these faults shall not be considered as significant; an appropriate explanation shall be given in the column "Yes (remarks)".

Section numbers in brackets refer to the corresponding subclauses of R 51-1.

GENERAL INFORMATION CONCERNING THE TYPE

Application no.:	Manufacturer:
Type designation:	Applicant:
Instrument category:	
	Complete instrument Module ¹
In automatic operation, instrument weighs:	dynamically statically
Accuracy cla	$\begin{array}{c c} \text{ass} & X(&) \\ \hline & Y(I) & Y(II) & Y(a) & Y(b) \end{array}$
$Min = $ $e = $ $e_1 = $ $e_2 = $ $e_3 = $ $T = + $ $U_{nom}^2 = $ $V = $	$Max = \boxed{\begin{array}{cccc} d = \boxed{\begin{array}{cccc} n = \boxed{\begin{array}{ccccc} n = \boxed{\begin{array}{cccccc} n = \boxed{\begin{array}{ccccccccccccccccccccccccccccccccccc$
Zero-setting device: Non-automatic Semi-automatic Automatic zero-set Initial zero-setting Zero-tracking	Tare device: Tare balancing Tare weighing Preset tare Subtractive tare Additive tare
Printer: Built in	Connected Not present but connectable No connection

¹ The test equipment (simulator or part of a complete instrument) connected to the module shall be defined in the test form(s) used. ² U_{nom} is the nominal voltage marked on the instrument, or the average of a voltage range, marked on the instrument.

Report page/.....

11 EXAMINATION OF THE CONSTRUCTION OF THE INSTRUMENT

Use this page to indicate any description or information pertaining to the instrument, additional to that already contained in this report and in the accompanying national type approval or OIML Certificate. This may include a picture of the complete instrument, a description of its main components, and any remark which could be useful for authorities responsible for the initial or subsequent verifications of individual instruments built according to the type. It may also include references to the manufacturer description.

Description:

12 CHECKLIST

The checklist has been developed based on the following principles:

- To include requirements that cannot be tested according to tests 1-10 above, but which shall be checked experimentally, e.g. the operating range of the tare device (3.6.3), or visually, e.g. the descriptive markings (3.11);
- To include requirements which indicate prohibitions of some functions, e.g. semi-automatic zero-setting devices shall not be operable during automatic operation (3.5.3.);
- Not to include general requirements, e.g. suitability for use (3.1);

This checklist is intended to serve as a summary of the results of examinations to be performed and not as a procedure. The items on this checklist are provided as reminders of the requirements specified in R 51-1 and they shall not be considered as a substitution for these requirements.

The requirements that are not included in this type evaluation report (tests 1-10 and checklist 12) are considered to be globally covered by the type approval or OIML Certificate (e.g. classification criteria (2.2 and 2.3), suitability for use (3.1)).

For non-mandatory devices, the checklist provides space to indicate whether or not the device exists and, if appropriate, its type. A cross in the box for "present" indicates that the device exists and that it complies with the definition given in the terminology. When indicating that a device is "not present", also check the boxes to indicate that the tests are not applicable (see p. 5).

If appropriate, the results stated in this checklist may be supplemented by remarks given on additional pages.

Mean of indicated readings:
$$\overline{I} = \frac{\sum_{i=1}^{n} I_i}{n} = \dots$$

Standard deviation:
$$s = \sqrt{\frac{\sum_{i=1}^{n} (x_i - \overline{x})^2}{n-1}} = \dots$$
